**TOWER AND FOOTHILLS LANDFILLS
DEBRIS, CONTAMINATED SOIL AND ASH DISPOSAL GUIDELINES
MARSHALL FIRE, BOULDER COUNTY COLORADO**

Cleaning up after a fire can be a challenging and dangerous activity that has immediate and long-term physical health risks and impacts to the environment. Fire debris can contain many types of hazardous materials. As a result, there are special requirements for handling, transporting, and disposing of fire debris.

TOWER AND FOOTHILLS LANDFILLS ACCEPTANCE POLICY

Debris, ash, and soil from ALL properties require a Special Waste Profile Form signed by the generator of the material to be disposed of. The Special Waste Profile Form can be found here: www.RepublicServices.com/businesses/special-waste

Other material that is not considered fire debris/ash/soil, such as spoiled food or other household trash items, may be disposed at Tower and Foothills Landfills as municipal solid waste or construction/demolition debris. This material would not require a special waste profile.

CLEANUP OF RESIDENTIAL PROPERTIES

Debris, ash, and soil from residential properties are assumed to contain asbestos-containing materials or other hazardous materials, but it may not be possible to properly characterize the material through inspection and/or testing. In these cases, this material may be accepted at the Foothills and Tower Landfills and managed as if it were asbestos-containing material. This material must be handled and packaged according to the Regulations. All loads delivered to the Foothills and Tower Landfills must be bagged and covered.

Debris, ash, and soil from residential properties that are known to contain asbestos-containing materials, or has been inspected and found to contain asbestos, may be disposed at the Tower Landfill. This material must be handled and packaged according to the Regulations. All loads delivered to the Foothills and Tower Landfills must be bagged and covered.

CLEANUP OF COMMERCIAL PROPERTIES

Commercial properties must evaluate the debris, ash, and soil, and ensure the waste is properly characterized based on potential contaminants, to include asbestos, prior to disposal. If the waste is found to be non-hazardous, the generator will need to identify the type of asbestos (if any) and submit the supporting documentation used to characterize the waste (lab results or safety data sheet) with a completed Special Waste Profile Form.

Debris, ash, and soil from commercial properties that are known to contain asbestos-containing materials, or have been inspected and found to contain asbestos, must be remediated by a certified asbestos abatement contractor and packaged for disposal in accordance with the Regulations. This material may be disposed at the Tower Landfill provided the waste is non-hazardous.

If no inspection can be safely conducted to determine whether a commercial property contains asbestos-containing material, the material is assumed to contain asbestos-containing material and may be disposed at the Tower and Foothills Landfills provided the waste is non-hazardous. This material must be handled and packaged according to the Regulations. All loads delivered to the Foothills and Tower Landfills must be bagged and covered.

Debris, ash, and soil that contain asbestos less than 1% may be disposed at the Foothills and Tower Landfills in accordance with the Regulations provided the waste is non-hazardous.

Customers with pre-established accounts (including prepayment or credit approval) may deliver waste to the Tower and Foothills Landfills. All other accounts will be set-up upon waste acceptance approval.

These guidelines for the management of waste generated as a result of the Marshall Fire are subject to change and are provided for general information only. These guidelines do not supersede any legal requirements that apply to the Tower and Foothills Landfills.
